

Maniac 2.0

Clean, coherent, professional.

A full design-system reset. One font, three radii, strict spacing, a rebuilt component library, and every current surface remade — popups, sidebars, player controls, downloader, and settings — shown across 8 real-use mockups.

Maniac Media Player

Design spec · generated from graphic-issue audit

Problems today

Six issues found across the shipped UI. All of them resolved in the new design system.

1. Five chips per panel → one cycle button

Five big chips (All P1..P4) were eating space in every panel. Replaced by a single 2×2 dot button that cycles through players — photographic memory across the whole app.

2. Playback bars disagree between players

P1, P2, P3 each shipped a different set of icons and heights. Bars normalized to one template: every player gets the same buttons in the same order, always.

3. Loud destructive action

Big red button permanently shown. Moved into an overflow menu with a confirmation modal.

4. Inconsistent button sizes

Four button base classes drift over time. Replaced by one `.btn` primitive.

5. Slider labels mis-aligned

Value labels sat in accent color and broke scanning. Now tabular nums in text-2.

6. Color picker density

7×6 packed squares. Opened up to 8-col grid with ring selection state.

Impostazioni · tile-grid tabs (File-panel continuity)

tile tabs match the File panel; Applica su = cycle button

replaces: ffds.png — underline tabs + strict spacing + new segmented control

tile primitive used in both; user memory travels

File & Impostazioni — one visual, two places

Same tile. Same spacing. Same hover. The File menu and the Settings tabs share a single layout primitive — users recognize one pattern, use it in two contexts.

Aspetto

Hover: lift & fill. Selected: accent background. Identical states in both contexts.

6 analysis modes with icons, single modal <460px wide

how to pick / request icons consistently across the app

Icon strategy — how to keep the library coherent

The app already ships 100+ Streamline Core SVGs in `/Icons/`. Policy: pick from this set first; never mix stroke weights, never mix filled + outline in the same view. When something is missing, extend `ICON_MAP` in `index.html` — don't drop an emoji.

DECISION FLOW

1. **Exists in `/Icons/`?** — use it via `icon('name')`.
2. **Missing but Streamline has it?** — drop the SVG into `/Icons/`, add an entry to `ICON_MAP`, recolor with `currentColor`.
3. **Brand new concept?** — sketch in Streamline style (1.75 stroke, rounded caps/joins, 24×24 viewBox, outline). Add to `/Icons/` and `MAP`. *No emoji*.
4. **Filled variants** only for CTAs (primary button, play button, download active). Everywhere else: outline.

RULES

- Stroke width: **1.75** · caps: round · joins: round.
- ViewBox: **24×24**. Rendered sizes: **12 / 16 / 22** (sm / md / lg).
- Color: **currentColor**. Never hard-code hex in SVG.
- Action icons follow verb semantics: *action* = *outline*, *status* = *filled*.
- One icon per concept, across the whole app. If "delete" is a trash can in Tags, it's a trash can in Cronologia too.

STANDARDIZED CONCEPT → ICON

 play riproduzione	 pause pausa	 fullscreen schermo intero	 download scarica
 delete elimina	 search cerca	 settings impostazioni	 security protezione
 face analisi volto	 favorite preferito	 layout multi-player	 tag etichetta

Workflow suggerito: quando ti serve un'icona in un nuovo contesto, descrivimi il significato verbale (es. "merge cluster", "eject USB"). Ti rispondo con il nome Streamline consigliato + lo snippet `icon('<name>')` da incollare. Zero guesswork, zero emoji.
